How to Use SkinSoft Visual Styler to Create Professional-Looking WinForms Applications

SkinSoft Visual Styler is a powerful tool that allows you to customize the appearance of your WinForms applications using Visual Styles and Skins. You can choose from over 2000 skins available in the Skin Gallery^[1] or import your own msstyles files using the Built-in Visual Style Import Tool. With SkinSoft Visual Styler, you can give your applications an instant modern and professional look that matches your branding and preferences.

In this article, we will show you how to use SkinSoft Visual Styler to create a simple WinForms application with a custom skin. We will assume that you have already installed SkinSoft Visual Styler on your computer and have a valid license key. If not, you can download a free trial version from the official website^[2].

Step 1: Create a new WinForms project in Visual Studio

Open Visual Studio and create a new Windows Forms App (.NET Framework) project. Name it "SkinSoftDemo" and click OK. You should see a blank form in the designer.

Step 2: Add some controls to the form

To demonstrate how SkinSoft Visual Styler works, we will add some basic controls to the form, such as buttons, labels, text boxes, check boxes, radio buttons, and a progress bar. You can arrange them as you like, but here is an example layout:

Step 3: Add a reference to SkinSoft.VisualStyler.dll

To use SkinSoft Visual Styler in your project, you need to add a reference to the SkinSoft.VisualStyler.dll file, which is located in the installation folder of SkinSoft Visual Styler (usually C:\Program Files (x86)\SkinSoft\VisualStyler.Net). To do this, right-click on the References node in the Solution Explorer and select Add Reference. In the Reference Manager window, browse to the SkinSoft.VisualStyler.dll file and select it. Click OK to add the reference.

Step 4: Add a VisualStyler component to the form

The next step is to add a VisualStyler component to the form. This component is responsible for applying the skin to your application. To do this, open the Toolbox and drag and drop a VisualStyler component from the SkinSoft tab onto the form. You should see a small icon on the bottom left corner of the form.

Step 5: Select a skin for your application

Now comes the fun part: choosing a skin for your application. To do this, select the VisualStyler component on the form and open its Properties window. Click on the Load button next to the StyleFile property. This will open a dialog box where you can browse through the available skins.

You can also use the Filter by Category drop-down menu to narrow down your choices. For this example, we will use the "Aquanox" skin from the "Aqua" category.

Click OK to apply the skin to your application. You should see an immediate change in the appearance of your form and its controls.

Step 6: Run your application and enjoy

You are done! You have successfully created a WinForms application with a custom skin using SkinSoft Visual Styler. You can run your application and see how it looks and behaves. You can also experiment with different skins and settings to find your favorite one.

We hope this article
